

Blood Supply of FACE

Main arteries of Head & Neck:

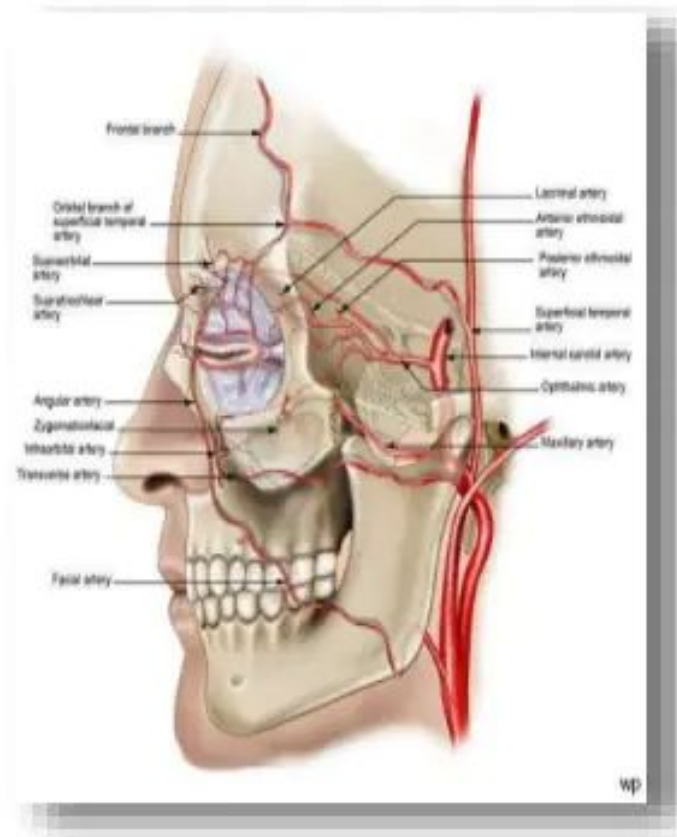

Arterial Supply of Face:

Facial Artery

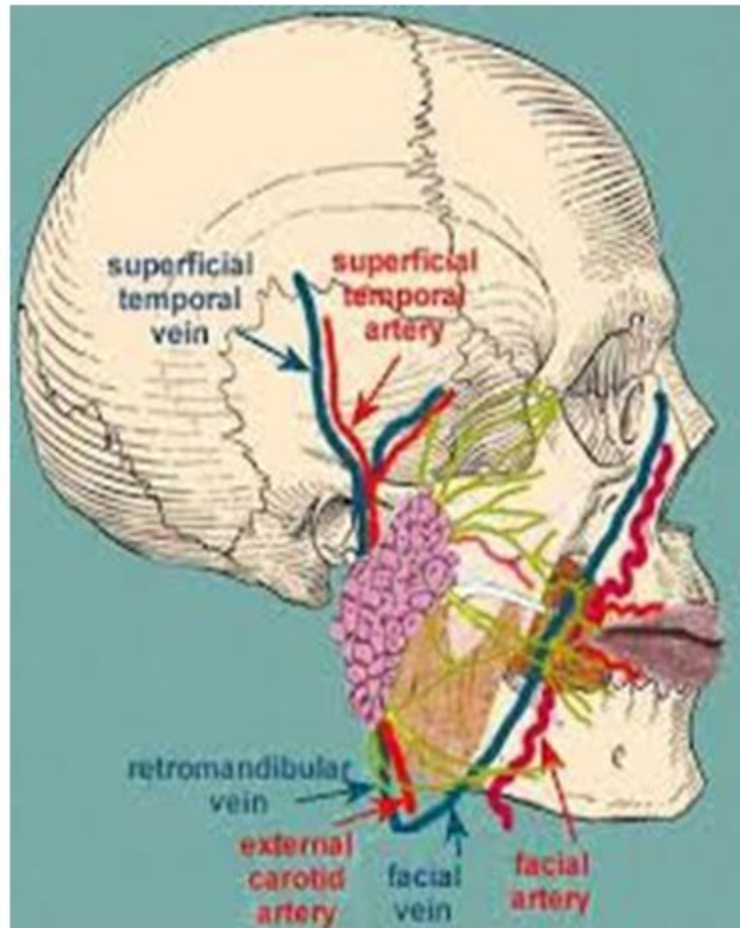

It is chief artery of face
It is branch of external carotid artery

Two parts of facial artery-

1. **Cervical part**- runs downwards in the neck
2. **Facial part**- on the face

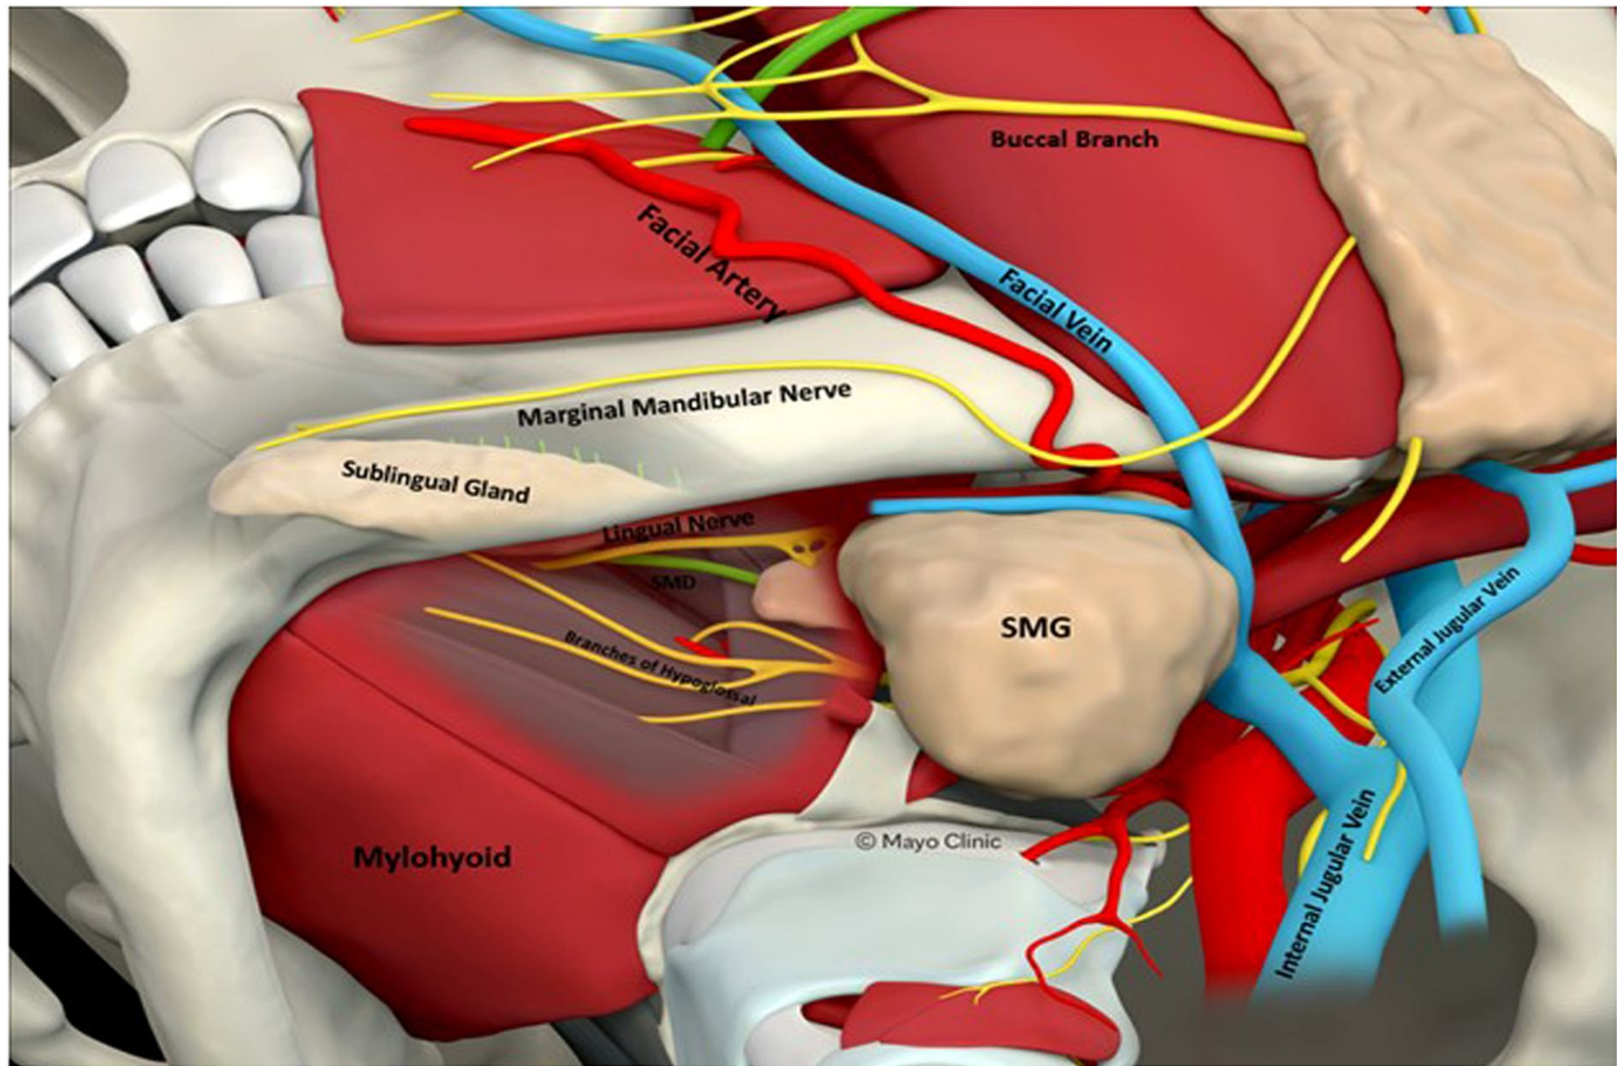

Course & Distribution of Facial Artery

- It arches upward deep to the submandibular salivary gland.
- It curves around the inferior margin of the body of the mandible at the anterior border of masseter muscle.
- It runs upward in a **tortuous course to the angle of the mouth** deep to the muscles. It ascends along the side of the nose to the medial angle of the eye.
- It terminates by anastomosing with the terminal branches of the ophthalmic artery.

Facial course of Facial Artery:

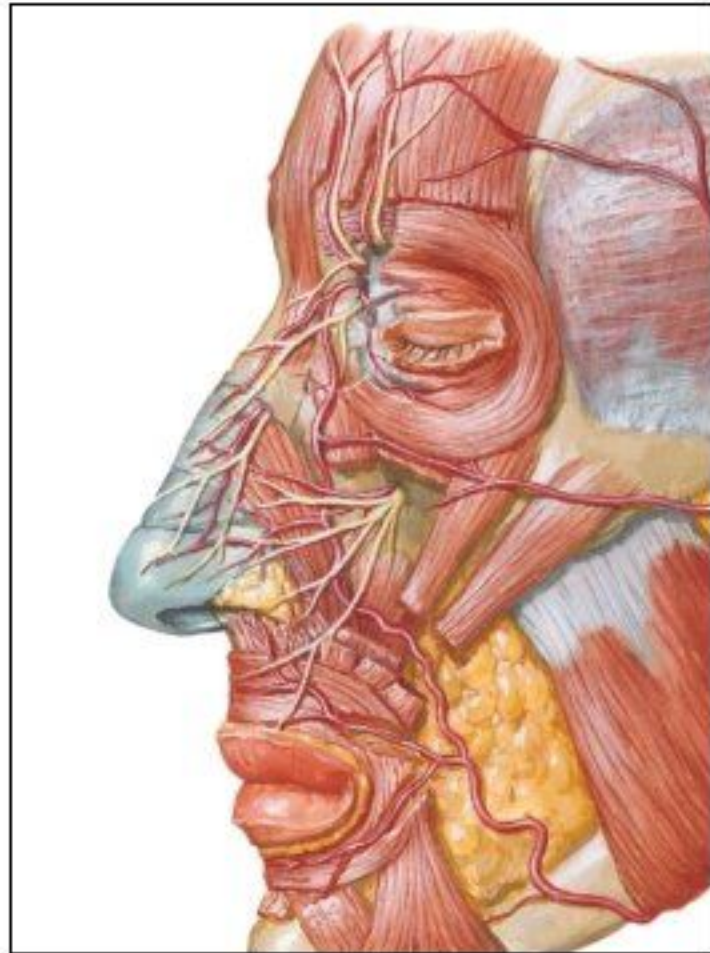

FACIAL ARTERY

Branches in the neck.

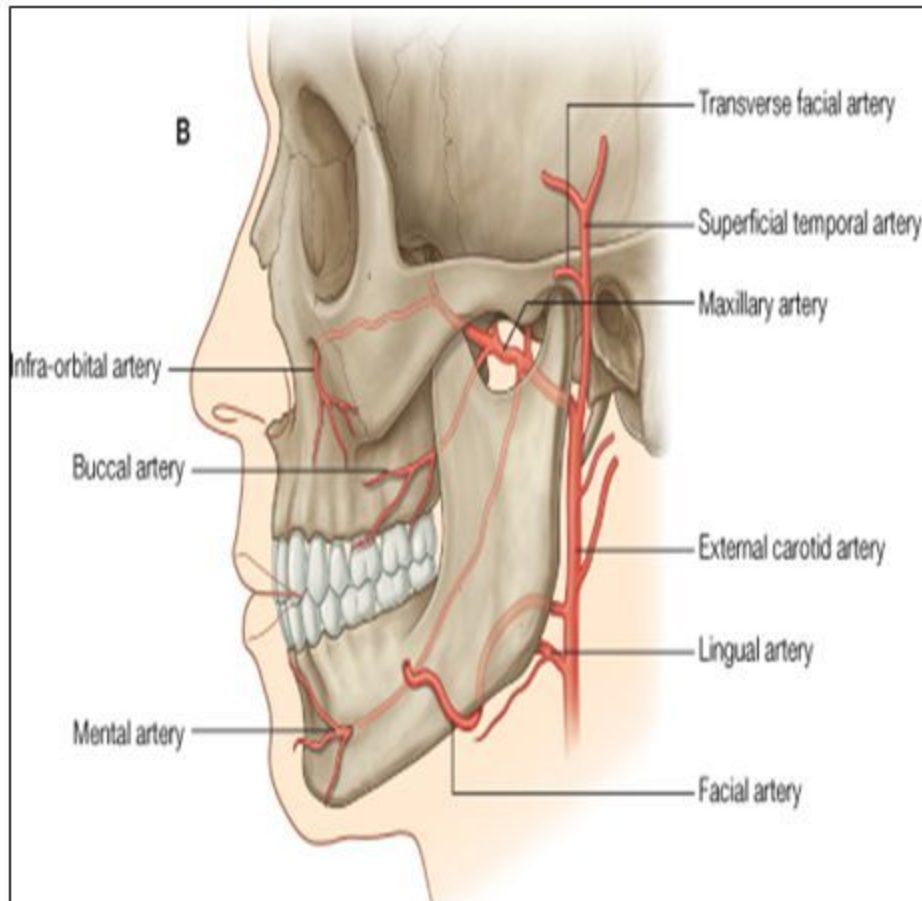

1. Ascending palatine artery.
2. Tonsillar artery
3. Submental artery
4. Glandular branches to submandibular gland.

Branches in the face.

1. Inferior labial artery.
2. Superior labial artery.
3. Lateral nasal artery.

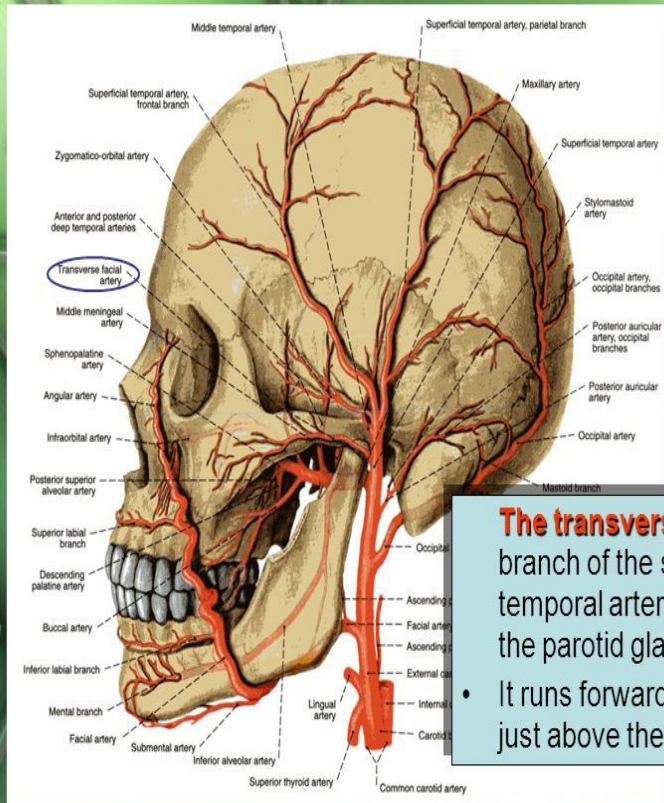

Where to feel Facial Pulsation?

- *As the artery crosses the inferior margin of the body of the mandible at the anterior border of the masseter muscle.*

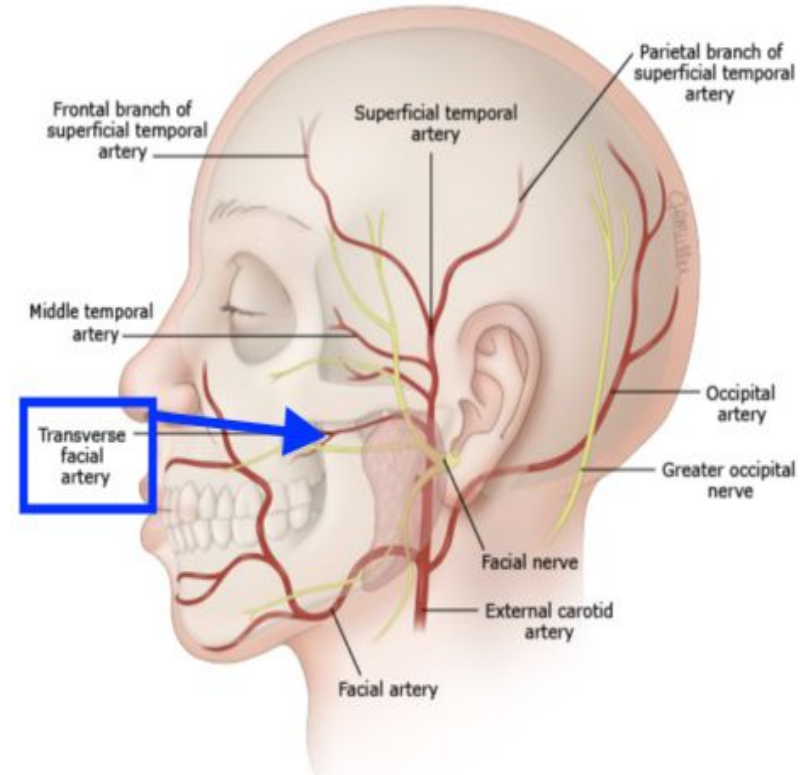

Transverse Facial Artery:

TRANSVERSE FACIAL ARTERY

The transverse facial artery, a branch of the superficial temporal artery, arises within the parotid gland.

- It runs forward across the cheek just above the parotid duct.

Internal carotid

External carotid

Supratrochlear

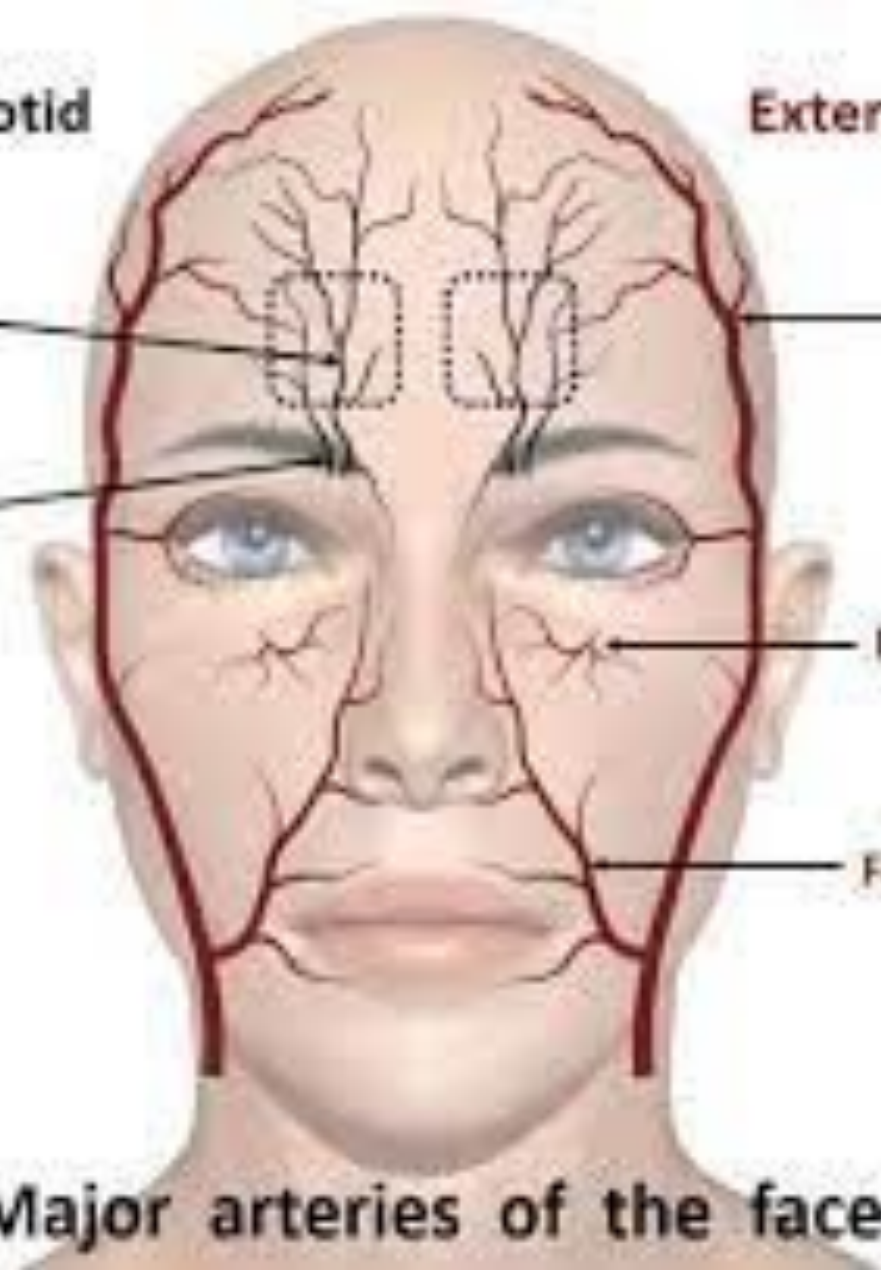

Superficial
temporal

Supraorbital

Infraorbital

Facial

Major arteries of the face

Venous Drainage of Face:

VENOUS DRAINAGE

The veins of the scalp accompany the arteries

supratrochlear and supraorbital forming the angular vein continues down as the facial vein

Superficial temporal vein join the maxillary vein to form the retromandibular vein

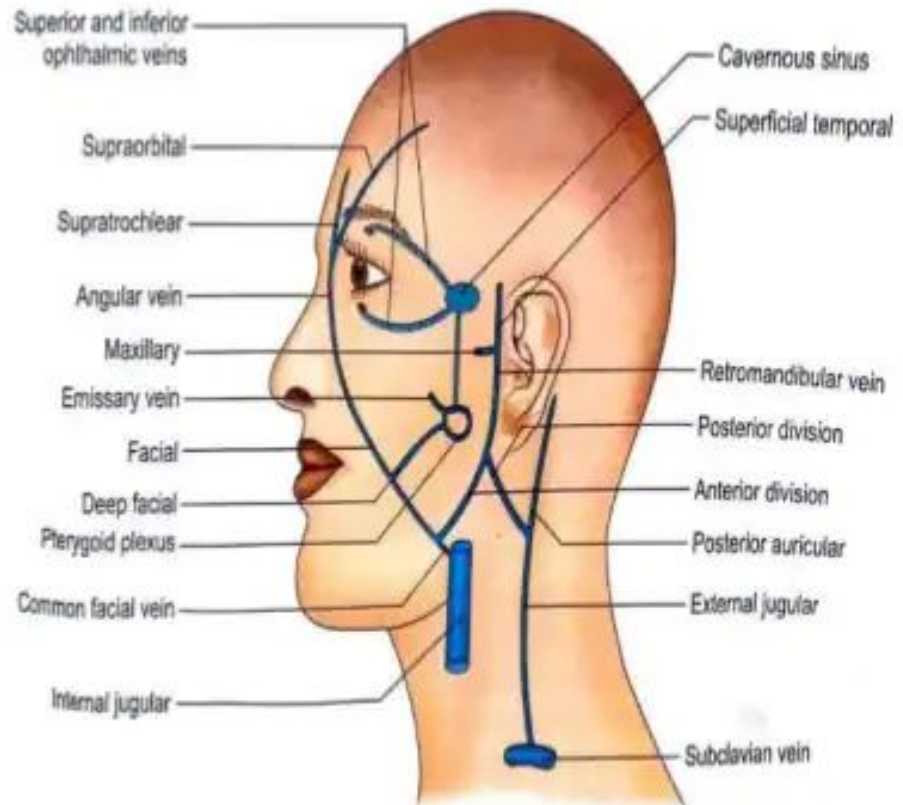

This vein divides into two division

Anterior division

Posterior division

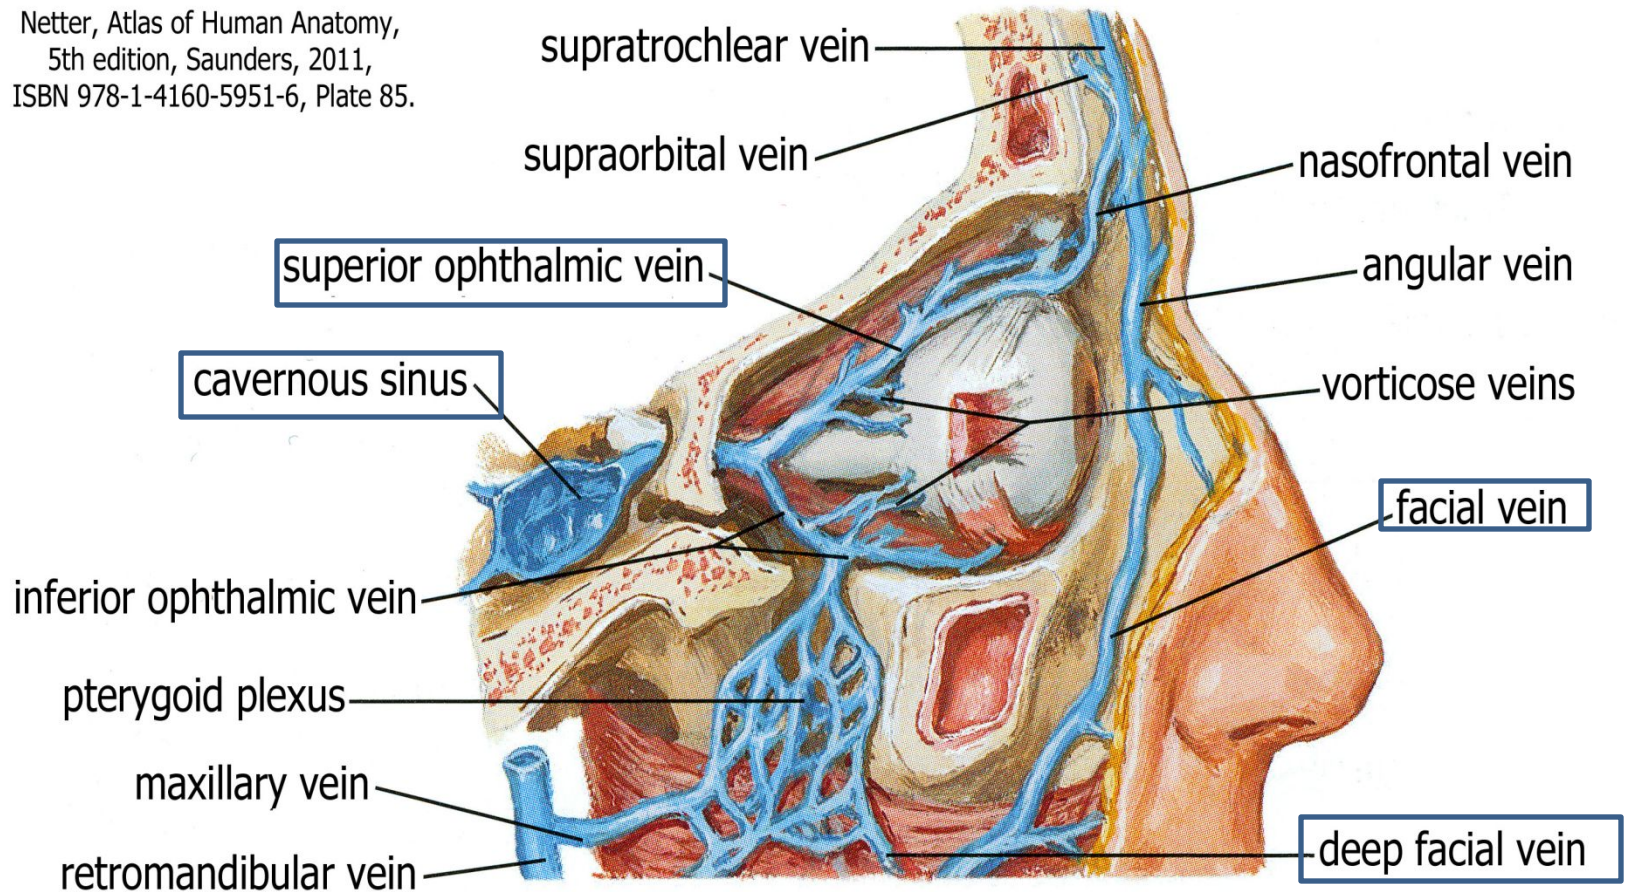

anterior division join the facial vein to form the common facial vein and finally drains into the internal jugular vein.

Posterior division join the posterior auricular vein to form the external jugular vein and finally drains subclavian vein.

Connections of facial vein:
